

# Garmo Forge ProofMesh

Proof-carrying mesh implementation

IP-2006 · Executed digital evidence · RTL / reference evaluation

## Function and architecture

- Proof-carrying mesh implementation

## Integration summary

Garmo Forge ProofMesh provides the documented proof / compute ip responsibility: Proof-carrying mesh implementation Evaluate the exact GF07-005 implementation and confirm its integration contract before using it inside the target design.

## Technical record

|                                   |                                                                               |
|-----------------------------------|-------------------------------------------------------------------------------|
| Canonical identity                | IP-2006                                                                       |
| Native implementation identity    | GF07-005                                                                      |
| Documented responsibility         | Proof-carrying mesh implementation                                            |
| Recorded evidence class           | Executed digital evidence                                                     |
| Interface and physical parameters | Bound to the selected source/configuration; not inferred from name or family. |

## Delivery and release binding

- Exact implementation and configuration manifest
- Documented interfaces and clock/reset contract
- Available reference or verification collateral
- Recorded physical views where authorized and applicable
- Integration acceptance criteria and unresolved gate list

Confirm for the selected release: Source/configuration identity, Interface and dependencies, Verification evidence, Process/library where applicable, Authorized package and acceptance criteria.

## Evidence and qualification

RELEASED PORTABLE SOFT IP — RTL, directed simulation, warning-clean lint and generic synthesis evidenced; bounded-formal collateral is partial; no PDK-bound physical closure, tapeout or silicon evidence.

Evidence shown is the Bible record for this canonical implementation, not a fresh tool rerun. External foundry acceptance, silicon measurements, standards certification and unlisted interface/physical

parameters are not inferred. Exact delivery and rights are agreed before licensing.

Canonical status: RELEASED PORTABLE SOFT IP — RTL, directed simulation, warning-clean lint and generic synthesis evidenced; bounded-formal collateral is partial; no PDK-bound physical closure, tapeout or silicon evidence.

Source basis: Bible v7.42 VERIFIED V29, IP-2006; PART LXVII - RELEASED PORTABLE SOFT-IP PORTFOLIOS (table 722, row 17).

## **Evaluation and licensing**

Evaluation: Review the exact recorded implementation and agreed test scope. Production: Named-design rights for the agreed qualified release. Custom work: Target integration, verification or physical qualification. Rights, pricing, support and acceptance criteria are agreed for the exact scope.
