

Consequence-Tagged Reliability Fabric

Consequence-class tag propagation and reliability policy fabric

IP-2017 · Executed digital evidence · RTL / reference evaluation

Function and architecture

- RTL exists
- 56/0 simulation
- BMC + induction proved
- generic synthesis top reported at 21,430 cells. Related to GSIS/GMA reliability policy but separately named

Integration summary

Consequence-Tagged Reliability Fabric provides the documented consequence-class tag propagation and reliability policy fabric responsibility: Consequence-class tag propagation and reliability policy fabric
Evaluate the exact IP-2017 implementation and confirm its integration contract before using it inside the target design.

Technical record

Canonical identity	IP-2017
--------------------	---------

Native implementation identity	IP-2017
--------------------------------	---------

Documented responsibility	Consequence-class tag propagation and reliability policy fabric
---------------------------	---

Recorded evidence class	Executed digital evidence
-------------------------	---------------------------

Interface and physical parameters	Bound to the selected source/configuration; not inferred from name or family.
-----------------------------------	---

Delivery and release binding

- Exact implementation and configuration manifest
- Documented interfaces and clock/reset contract
- Available reference or verification collateral
- Recorded physical views where authorized and applicable
- Integration acceptance criteria and unresolved gate list

Confirm for the selected release: Source/configuration identity, Interface and dependencies, Verification evidence, Process/library where applicable, Authorized package and acceptance criteria.

Evidence and qualification

RTL exists; 56/0 simulation; BMC + induction proved; generic synthesis top reported at 21,430 cells. Related to GSIS/GMA reliability policy but separately named.

Evidence shown is the Bible record for this canonical implementation, not a fresh tool rerun. External foundry acceptance, silicon measurements, standards certification and unlisted interface/physical parameters are not inferred. Exact delivery and rights are agreed before licensing.

Canonical status: RTL + SIMULATION + FORMAL INDUCTION + GENERIC SYNTHESIS EVIDENCED — no physical implementation or silicon evidence.

Source basis: Bible v7.42 VERIFIED V29, IP-2017; 68.1 Standalone synthesized IP (table 723, row 7).

Evaluation and licensing

Evaluation: Review the exact recorded implementation and agreed test scope. Production: Named-design rights for the agreed qualified release. Custom work: Target integration, verification or physical qualification. Rights, pricing, support and acceptance criteria are agreed for the exact scope.
