

SONJE-P64 PASID / IOMMU / Authority-Version-Lock Access Guard RTL

Enforces PASID, domain, epoch, permission, expected-version and lock eligibility together at P64 memory acceptance.

IP-3938 · Executed digital evidence · RTL / reference evaluation

Function and architecture

- Enforces PASID, domain, epoch, permission, expected-version and lock eligibility together at P64 memory acceptance.

Integration summary

SONJE-P64 PASID / IOMMU / Authority-Version-Lock Access Guard RTL provides the documented memory security rtl responsibility: Enforces PASID, domain, epoch, permission, expected-version and lock eligibility together at P64 memory acceptance. Evaluate the exact SONJE-P64-IP-004 implementation and confirm its integration contract before using it inside the target design.

Technical record

Canonical identity	IP-3938
Native implementation identity	SONJE-P64-IP-004
Documented responsibility	Enforces PASID, domain, epoch, permission, expected-version and lock eligibility together at P64 memory acceptance.
Recorded evidence class	Executed digital evidence
Interface and physical parameters	Bound to the selected source/configuration; not inferred from name or family.

Delivery and release binding

- Exact implementation and configuration manifest
- Documented interfaces and clock/reset contract
- Available reference or verification collateral
- Recorded physical views where authorized and applicable
- Integration acceptance criteria and unresolved gate list

Confirm for the selected release: Source/configuration identity, Interface and dependencies, Verification evidence, Process/library where applicable, Authorized package and acceptance criteria.

Evidence and qualification

rtl/p64/security/sonje_p64_access_guard.sv + formal/p64 access proof + P64 evidence

Evidence shown is the Bible record for this canonical implementation, not a fresh tool rerun. External foundry acceptance, silicon measurements, standards certification and unlisted interface/physical parameters are not inferred. Exact delivery and rights are agreed before licensing.

Canonical status: P1 / 128-CASE LOCAL MATRIX PASS + SAT GATE OBSERVED PASS

Source basis: Bible v7.42 VERIFIED V29, IP-3938; 104.6 New canonical SONJE-P64 records - 17 net-new implementation identities (table 801, row 5).

Evaluation and licensing

Evaluation: Review the exact recorded implementation and agreed test scope. Production: Named-design rights for the agreed qualified release. Custom work: Target integration, verification or physical qualification. Rights, pricing, support and acceptance criteria are agreed for the exact scope.
